The 2016 Greater Los Angeles Homeless Count

1. Executive Summary

The Carolina Survey Research Laboratory (CSRL) at the University of North Carolina at Chapel Hill (UNC-CH) and the Los Angeles Homeless Services Authority (LAHSA) collaborated in the design, implementation and analysis of the 2016 Greater Los Angeles Homeless Count (HC16). The CSRL's responsibilities were to provide methodology and process direction, to design and select all required samples, to develop estimation strategies, and to produce weighted survey estimates with relative standard errors where applicable. LAHSA's roles included managing all other data collection tasks, which included conducting the street and shelter counts, the contents of survey questions and forms, administering the demographic survey, compiling the estimates for presentation, and conducting a separate youth count.

As in previous years, sampling played an important role in HC16. The geographic area targeted for all of these samples was the Los Angeles Continuum of Care, which defines the coverage area of the homeless services it provides.¹ In all, three sets of counts or rates of homelessness required some type of sampling for estimation purposes. They included (i) counts of adult (>24 y.o.) street homeless persons from a sample of well-defined geographic areas within the CoC; (ii) counts of youth (<25 y.o.) street homeless persons from a sample of well-defined geographic areas within the CoC; & (iii) subpopulation estimates (e.g., veteran status, mental illness, chronic homelessness) from information gleaned from face-to-face surveys of the target populations. Shelter counts were complete enumerations and considered free of sampling error with subpopulation estimates coming from the Homeless Management Information System (HMIS). The overarching goal of HC16 was to provide the homeless estimates LAHSA needed to plan and maintain its service programs.

Measures of the statistical quality were produced in the form of estimated standard errors wherever possible. HC16 street estimates were produced in SAS (Version 9.4), a statistical software package that is used to analyze data from complex sample surveys. SAS not only produces point estimates from survey data, but also enables us to compute the corresponding standard errors of these estimates using an appropriate survey design. Estimates at the CoC and Service Planning Area (SPA) level were the most precise since the sample was designed to include this capacity. However, some estimates at the city council district (CD) level, as well as for some of the other population subgroups specified for estimation by LAHSA,

¹The Los Angeles Homeless Services Authority (LAHSA) Community of Care (CoC) includes all of Los Angeles county except for the cities of Pasadena, Glendale and Long Beach.

proved to be unstable because of the small sample sizes. They should be used with caution to the extent that the estimated relative standard error (RSE) exceeds 30%.

2. Background and Overview

As in the past, statistical sampling played an important role in the study of homeless persons in the Los Angeles Continuum of Care (CoC) Point-in-Time (PIT) Count. The Carolina Survey Research Laboratory (CSRL) once again partnered with the Los Angeles Homeless Services Authority (LAHSA) in conducting the Los Angeles Homeless Count for 2016 (HC16). LAHSA's roles were to establish the information goals and to organize and manage all HC16 data field data gathering activities in the CoC. The CSRL's complementary responsibilities were to provide all needed technical assistance in conjunction with statistical sampling to produce findings for LAHSA to report from the data collected in all HC16 survey components given below. The overarching goal of HC16 was to produce the best possible estimates of homeless counts for the CoC as well as for numerous geographic and other defined subgroups of the CoC.² The target area of all HC16 samples was the CoC, which defines the coverage area of the homeless services LAHSA performs.³ LAHSA uses these findings to plan, maintain, and justify its service programs.

3. Adult Homeless Street Count Sample

The overall adult street homeless count for the CoC, as well as for various jurisdictions within the CoC (viz., SPAs, CDs, & SDs) was randomly sampled from 2,155 census tracts⁴. It was agreed that the CSRL would: (i) develop the design for a sample of census tracts (CTs) that meet the minimum precision requirements of 15% relative standard error (RSE) for each SPA (sample sizes by other geographic jurisdiction will not be controlled through stratification), (ii) select the sample of CTs based on the design, (iii) review the survey questionnaires and forms developed by LAHSA, and (iv) perform the initial analysis of the collected sample data to enable LAHSA to report important current findings for the CoC.

3.1 Design Summary

The initial design was to be a stratified single-stage without-replacement simple random sample of 2,053 out of the 2,155 Census Tracts that comprise the CoC for LAHSA.

² Geographic subgroups importance for the design of samples for HC16 will be limited to those defined by Service Planning Area (SPAs), Los Angeles County Supervisorial District (SD), and the City of Los Angeles (CD). "Other defined subgroups" will be limited to those defined by any of the following: people in families, single persons, chronically homeless, people with severe mental illness, people with chronic substance abuse problems, veterans, people with HIV/AIDS, victims of partner abuse, and people with disabilities.

³ The LAHSA CoC includes all of Los Angeles County except for the cities of Pasadena, Glendale and Long Beach.

⁴ 2010 census tracks were used in 2016

3.2 Stratification and Allocation

Stratification was used in several ways to produce a sample of CTs in HC16: (i) to improve the precision of the homeless count estimates by including hotspots (versus non-hotspots); (ii) to control the composition of the sample by SPA (1-8) to facilitate estimating homeless counts for these jurisdictions; and (iii) to produce homeless estimates for cities enumerating all the census tract in their boundary area (opt-ins). By using SPA, hotspot, and opt-in status, we created 24 strata plus one additional strata to capture the uniqueness of skid row (label SPA 9 in the table below).

3.3 Selection and Field Operations

Simple random sampling without replacement was used to select the sample of CTs in each of the 25 strata. We applied SAS *PROC SURVEYSELECT* to an established frame file of CTs in the CoC to randomly choose the CT sample and record their corresponding selection probabilities for subsequent weight computations. Since CT nonresponse did not occur, there was no need to select a substitute sample of CTs in each stratum.

3.4 Sample Weights

Since there was no nonresponse in counting street homeless in the sample of 2,053 CTs, the sample weight for each CT in this sample was simply the inverse of its selection probability (i.e., the sampling rate for the stratum in which the CT was chosen, N_h/n_h).

4. Homeless Shelter Count (No Sampling)

The HC16 count of shelter homeless was completed for all shelters in the CoC. This 100% enumeration of homeless residents was conducted by LAHSA staff and produced the total number of current sheltered homeless in the CoC at the end of January 2016.

4.1 Design Summary

The shelter counts were from a 100% enumeration of shelters, and thus not subject to sampling error. This does not preclude the possibility of other sources of error in these estimates (e.g., due to measurement), however.

4.2 Stratification and Allocation

The 2016 Housing Inventory Chart of emergency shelters, transitional housing and safe havens was used as a base for compiling a complete shelter list in the CoC. It was vetted with input from homeless coalitions, shelter providers, and LAHSA staff.

4.3 Selection and Field Operations

The night a facility reported its homeless numbers was dependent upon where that facility was located. Agencies with programs located in Service Planning Areas (SPAs) 3 and 7 performed their counts on the night of January 26th; SPAs 2, 5 and 8 were performed on January 27th; and SPAs 1, 4 and 6 were performed on January 28th. These nights corresponded with the nights of the street count. Quality checks comparing capacity to occupancy, zero count reports, prior count reports, as well as other measures were taken to

improve response accuracy. In all, 288 shelters were included for the point-in-time shelter census. The response rate was 100%. See Appendix D for a tally of the shelter counts.

5. Demographic Survey – Adult Street Homeless Sample

The sample for the face-to-face (F2F) survey conducted in the streets was chosen from a stratified sample of 409 CTs which was randomly selected from the 2053 CTs used in the PIT count. As in HC15, replacement (random or otherwise) of selected CTs was disallowed for the street homeless sample. Data collection occurred between January 15 to March 4, 2016 by LAHSA staff.

5.1 Design Summary

As in HC15, the design for sampling street homeless persons called for a two stage random selection of street homeless persons from a stratified (without replacement) simple random sample of 409 CTs that served as PSUs that was followed by the random (second stage) selection and interviewing all street homeless persons within each sample CT at the time of the interview. At the conclusion of data gathering and cleaning, respondent data were available for 4,851 street homeless persons sampled from the selected CTs.

5.2 Stratification and Allocation

Allocation of the sample of 409 CTs was based on the HC15 Neyman allocation of the overall sample size and the optimum delineation to street sample within SPA. Average sample cluster sizes in this allocation of CTs and the prior allocation of street homeless respondents implied average respondent sample cluster sizes of around 17-18 in each SPA.

The targeted number of selected CTs in the h^{th} stratum (n_h) was determined so that within each SPA the two sampling strata corresponding to HC16 hotspot and non-hotspot CTs. CTs were then selected with sampling rates that were proportional to the average estimated HC15 homeless street count in the stratum (\bar{c}_h). No stratification was imposed in identifying the sample of homeless persons within each sample CT (the SSU).

5.3 Selection and Data Collection

Within each of the 409 selected CTs, all street homeless persons were approached for an interview and given a \$5 gift card for their participation. Since there was no direct way to determine within-CT selection probabilities for homeless persons based on this sampling approach, we have assumed it to be a simple random sample of homeless persons out of the number of homeless street homeless based on the count from HC16. While in HC15 the reality of the sampling and interviewing operation was that not all CTs were visited for various reasons (e.g., the location was considered too remote, there was too large an area to cover, too few homeless persons, etc.), LAHSA agreed to complete sampling and interviewing work per these specifications in all 409 CTs for HC16. Targeted sample sizes per CTs were provided to LAHSA staff. In some CTs they exceeded the targeted sample size and in others they found no homeless to interview. After

duplicates were removed (via initials and birthdate), we were left with 4,851 street interviews. (See Appendix A for a copy of the survey instrument.)

5.4 Sample Weights

A sample weight (i.e., a nonresponse adjusted “base weight”) for each individual homeless respondent in the street segment of the demographic survey was computed for each survey respondent in two basic steps: (1) compute a pre-calibration weight as the inverse of the respondent’s overall nonresponse-adjusted selection probability, which is the probability of selecting its CT (i.e., the CT sampling rate within its PSU stratum) multiplied by the probability of the respondent being selected and responding within its CT; and (2) calibrate the adjusted base weight so that the calibrated final weights, when summed among respondents in each PSU stratum, equals the final HC16 Homeless Count estimates by stratum for the street count. (See Appendix C for Adult Street Count Estimates.)

6. Demographic Survey – Shelter Homeless Data

As in HC15, the data used to produce shelter homeless estimates came from the HMIS (Homeless Management Information System) database. It included 13,691 records taken from shelters in the CoC for the month of December 2015 that were considered active residents. For the purposes of producing HC16 sheltered subpopulation estimates, the sample was assumed to represent the entire sheltered homeless population for the month of January, which corresponds to the same time period that the sheltered count occurred. Therefore, HMIS data were treated as a census or complete coverage of the sheltered population and was considered self-weighted. (See Appendix D for the Shelter Count.)

7. Youth Homeless Street Count Sample

7.1 Design Summary

Inclusion of a separate youth count in the unsheltered street totals was made possible in HC16 by picking an independent sample of census tracts (CT) from the Los Angeles Continuum of Care and implementing a survey-based enumeration process. Being a survey-based design, both youth counts and sub-population estimates were based off one design.

7.2 Stratification and Allocation

Sampling involved producing a manageable set of CTs that could be canvassed by the LAHSA youth team (n=301). CTs within each of the nine Service Planning Areas were classified as either hotspots (larger than average number of youths from previous counts), non-hotspots (smaller than average size but not 0), or zero counts (no known youths) for a total set of 27 (9*3) strata, with Skid Row pulled out of separately as SPA 9. There were 78 hotspots that were taken with certainty, 150 out of 290 non-hotspots, and 73 out of 1,787 zero count CTs included in the sample. Methodology here was similar to the adult demographic survey (See Table 3 below.)

7.3 Selection and Data Collection

Youth were considered eligible if they were under 25 years of age and lived on the streets or in areas unfit for human habitat (e.g., cars, tents, abandoned buildings, unconverted garages, sheds or attics). LAHSA enumerators were instructed to approach all youth who appeared 25 years of age or less to determine eligibility and record refusals from eligible youths only. (See Appendix B for the youth survey instrument.)

7.4 Sample Weights

Weights were determined by the inverse probability of selection after correcting for unit nonresponse. All estimates, including totals, were weighted and took the survey design (strata) into account (same approach used in the adult demographic survey). The estimated youth total for the CoC was 2,388 (± 694). This is likely to be an undercount of the unsheltered youth population because youth counts on the sampling frame are not as well established as adult counts so the sampling frame is not as reliable or efficient in determining hotspots versus non-hotspots. Youth estimates will improve when the hotspots stabilize and more CTs are covered in the youth count. (See Appendix E for the unsheltered youth estimates.)

8. Producing Estimates for 2016 Homeless Count

8.1 Street Count Estimates

HC16 street estimates were produced in SAS (Version 9.4), a statistical software package that is used to analyze data from complex sample surveys. SAS not only produces point estimates from survey data, but also enables us to compute standard errors of these estimates reflecting key features of the sample design that was followed in producing the data from which the estimates were derived. Estimated street totals and their associated standard errors were produced using the PROC SURVEY procedures in SAS.

Unsheltered street counts were thus extrapolated using actual accounts from sampled tracts which took into account how the sample was drawn (i.e., probability of selection and stratification). See Appendix C for the unsheltered street estimates using SAS.

An important component of the unsheltered street estimation process was producing good estimates for the number of people assumed to be in cars, vans/campers, tents and encampments, since some field observations used to produce the estimates utilized counts of these things. Given that volunteers could not determine these assumed numbers of homeless persons per unit during the January street counts, estimates had to be produced and multiplied by the number of times such observations occurred. These so-called conversion factors were based on data gathered in the demographic survey in which respondents were asked to estimate the number of people that typically stayed with them under such circumstances. The weighted estimates from the demographic survey produced the following conversion factors for HC16: i) cars = 1.48; ii) vans = 1.65; iii) campers/RVs = 1.90; iv) encampment = 1.59; and v) tents = 1.56. Since the demographic weights are dependent on the street count, iterative procedures were implemented. These conversion factors are assumed to be constants, and thus did not contribute to the estimated sampling error of our estimates.

8.2 Street Family Count Estimates

In 2009, we realized that street count family estimates were being underestimated due to the likelihood that some families were somewhat sheltered on the streets by seeking shelter in cars, vans, campers, and encampments. To produce conversion factors for this scenario, we again used results from the demographic survey, but split estimates based on the likelihood that a family was present, and when present the average

family size. Based on answers to the HC16 demographic survey, we estimated that 1 percent of people in tents were likely to be families, 1 percent encampment dwellers were likely to be families, 12.46 percent of families were residing in cars, 10.20 percent in vans, and 10.19 percent in campers. Individual and family conversion factor estimates also changed as seen in Table .

Table 4. Family and Individual Conversion Factors based on Observable Street Conditions

<i>DWELLING TYPE</i>	<i>Family Conversion Factor</i>	<i>Individual Conversion Factor</i>
Encampment	3.29	1.59
Car	2.06	1.48
Van	2.32	1.65
Camper/RV	1.93	1.90
Tent	2.74	1.56

8.3 Annualized Estimates

Annualized estimates were produced in the same manner as HC15 and guided by procedures established by Burt and Wilkins (2005). The formula was modified to facilitate production of annualized subpopulation estimates and is conceptually equivalent (see Figure 1 below).

Figure 1: Original Formula to Produce Annual Homeless Estimates

	A	B	C	Annual Estimate
$A + \lceil (B * 51)(1 - C) \rceil$	43,854			156,431
Sheltered Adult	9,921	4208	0.7492	63,741
Sheltered Youth	1,152	609	0.6615	11,667
Unsheltered Adult	30,393	829	0.1411	66,707
Unsheltered Youth	2,388	395	0.4079	14,316

Where,

A = Point-in-Time Count;

B = Homeless within past 7 days, new to the area in past 7 days, or left the county during the past 7 days;

C = Proportion who have been previously homeless in the past 12 months;

Figure 2: CSRL Modified Formula to Produce Annual Homeless Estimates

	A_c	L_p	C_p	Annual Estimate
$A_c \left[1 + \left((51 * L_p) (1 - C_p) \right) \right]$	43,854			156,431
Sheltered Adult	9,921	0.4242	0.7492	63,741
Sheltered Youth	1,152	0.5286	0.6615	11,667
Unsheltered Adult	30,393	0.0273	0.1411	66,707
Unsheltered Youth	2,388	0.1654	0.4079	14,316

Where,

A_c = Point-in-Time Count;

L_p = Proportion who have been homeless within past 7 days, new to the area in past 7 days, or left the county during the past 7 days;

C_p = Proportion who have been previously homeless in the past 12 months;

The HC16 CoC annual homeless estimate, therefore, is 156,431. That is, over the course of one year LA's Continuum of Care can expect to see more than 156,431 homeless persons. The annual formula takes into account the number of people who became homeless within the last seven days or, if already homeless, if they are new to the area or left the county during the past 7 days (L_p). The assumption here is that this influx of homeless people is constant so it is multiplied by 51 to represent the remaining weeks of the year. However, this estimate will overestimate the annual projection because some people will become homeless more than once during the year. Therefore, the annual projection is corrected by $1 - C_p$ or the proportion of people homeless only once in the past year. The UNC-CH modified formula is equivalent to the Burt and Wilkins formula and eases calculations of multiple projections. Weighted sums were used to produce estimates of L_p and C_p . Ratios proved to be unstable.

8.4 Subpopulation Estimates

To produce estimates for important homeless subpopulations such as the chronically homeless, mentally ill, substance abusers and so on, prevalence rates of the specific subpopulation among all homeless persons first needed to be estimated from the demographic survey. If we use \hat{p} to denote this estimate, then the count of this subpopulation for on-street homeless is estimated to be $\hat{p}\hat{C}$, where \hat{C} is the total count estimate for the on-street homeless.

By linearized approximation method, its standard error for use in producing street count findings in Appendix F is estimated to be

$$\sqrt{\hat{p}_{street}^2 Var\left(\hat{C}_{street}\right) + \left(\hat{C}_{street}\right)^2 Var(\hat{p}_{street})}$$

Similarly, the count for the youth population is estimated to be $\hat{p}_{youth}\hat{C}$, where \hat{C} is the total count estimate for the on-street youth homeless. Its standard error, as used to produce the street youth count estimates in Appendix F, is estimated as,

$$\sqrt{\hat{p}_{youth}^2 Var\left(\hat{C}_{youth}\right) + \left(\hat{C}_{youth}\right)^2 Var(\hat{p}_{youth})}$$

For the total count of the subpopulation, the estimate is given as $\hat{C}_{street} + \hat{C}_{youth}$, with the standard error given by

$$\sqrt{\hat{p}_{street}^2 Var\left(\hat{C}_{street}\right) + \hat{p}_{youth}^2 Var\left(\hat{C}_{youth}\right) + \left(\hat{C}_{street}\right)^2 Var(\hat{p}_{street}) + \left(\hat{C}_{youth}\right)^2 Var(\hat{p}_{youth})}$$

Appendix F includes our subpopulation estimates with estimated standard errors (represented as relative standard errors or RSEs which is simply determined by the standard error of an estimate, divided by the estimate and expressed as a percentage). Precision of estimates can only be ascertained with appropriately derived standard errors. Estimates at the CoC and SPA are generally very good. Precision decreases as sample size decreases at the CD-level however.

SPECIAL NOTE: We recommend that data users verify any public release estimates by first examining the estimate in Appendix F and determining if the relative standard error (RSE) is less than 30. The general rule of thumb given by the CDC, for example, is that estimates with a relative standard error greater than 30% should be suppressed and not released for public use (i.e., the estimate is too unstable).

Youth Demographic Survey

[Tip: In approaching homeless youth, walk slowly up to them, smile, shake their hand, and introduce yourself]

Interviewer: “Hi, my name is [say your name]. What is your name? Nice to meet you, [say their name].

I am volunteering with the Los Angeles Homeless Services Authority (LAHSA), which works with many community organizations—including [name of partnering youth agency]—to help those in need of safe and stable housing. Today we are conducting the Youth Count, which includes doing a brief survey that will help us better understand the housing and service needs of young people in the community, and bring additional resources to help youth.”

“The survey takes about 15-20 minutes. The results of this Youth Count survey will be used to improve the quality and variety of housing and services available for unsheltered youth in LA County. **If you decide to participate, pass the prescreening and are eligible, and complete the survey,** I’ll be providing a ten-dollar gift card to either McDonald’s or Subway, depending on your preference. Your answers are completely confidential and any question refused will not result in denial of any kind of services. Do you have any questions? [pause and wait for any questions]”

“Would you like to take this survey?” ☐ Yes ☐ No →  → Go to STAFF USE ONLY

[Tip: Fill in the bubble or square answer choices completely and within the bubble or square (for example, ☐ → ●). Cross out mistakes (for example, ✕).

PRESCREENING

Interviewer: “Thank you for your willingness to participate in our survey. Before beginning the actual survey, however, we would like to ask you a few prescreening questions to determine whether you are eligible to take this survey. We prescreen in order to ensure that we capture information and experiences from unsheltered youth who are in need of stable and permanent housing. If you do not pass this prescreening, you will not be able to take the survey and receive the ten-dollar gift card. Do you have any questions? [pause and wait for any questions] Please feel free to ask any questions at any time during the survey.”

“Have you taken the Youth Count survey this week?” ☐ Yes →  → Go to STAFF USE ONLY ☐ No

1. How old are you?

Question Logic: If 25 years old or older, let them know they are not eligible and go to Staff Use Only.

DEMOGRAPHICS

Interviewer: “Great, now that we know you are eligible, let’s proceed with the survey. First, I would like to ask you some basic demographic questions about yourself. Remember, like I had mentioned before, your answers are completely confidential and any question refused will not result in denial of any kind of services. Some of the survey questions will be sensitive, would you like to move to a more private space before we begin? [*once settled, then begin*] Let’s begin! [*start on question 3 and ask questions in chronological order for the entire survey*]”

[**Tip:** In asking questions, be alert of possible question logic. For questions that have logic, “Question Logic” will be in red]
